

printed circuit board to which the end of the contact member opposite to the contact end is coupled, and the printed circuit board being adapted to permit testing equipment to be coupled to the printed circuit board.

11. (Amended) An interface device according to claim 1, where the movable member is coupled to the body member by an elastically flexible member.

14. (Amended) An interface device according to claim 11, wherein the body member, the elastically flexible member and the movable member are fabricated from a metal material.

15. (Amended) An interface device according to claim 11, wherein the elastically flexible member is in the form of an elastic beam which is generally U-shaped.

16. (Amended) An interface device according to claim 11, wherein the movable member is coupled to the body member by a number of elastically flexible members.

17. (Amended) An interface device according to claim 1, wherein the body member encircles the movable member.

18. (Amended) An interface device according to claim 1, wherein the movable member defines an aperture into which the contact members protrude.

19. (Amended) An interface device according to claim 1, and further comprising an excitation device to move the movable member with respect to the body member.
